1. Overview and description

Family Effectiveness Training (FET) is a family-based program for Hispanics that targets family factors known to place children at risk. FET helps Hispanic immigrant families with children ages 6 to 12, particularly when the child is exhibiting behavior problems, associating with deviant peers, or experiencing parent–child communication problems. The goal of FET is to strengthen families by increasing their ability to adapt to new situations, particularly developmental and cultural challenges the family will face. The program consists of three components: Family Development, Bicultural Effectiveness Training, and Brief Strategic Family Therapy. FET uses two primary strategies to initiate change: 1) didactic lessons and participatory activities that help parents master effective family management skills and 2) organized discussions in which the therapist/facilitator intervenes to correct dysfunctional communications between or among family members. The training sessions last for 13 weeks, are 1½ to 2 hours long, and are tailored to each individual family.
2. Implementation considerations (if available)

Family Effectiveness Training requires committed, enthusiastic, sympathetic counselors who are familiar with and respectful toward multicultural settings, languages, and values. Minimum professional qualifications include basic knowledge of how family systems operate and 3 years experience working with children and families. The ideal candidate has a master's degree in social work, or marriage and family therapy, or mental health counseling. However, individuals with a bachelor’s degree and equivalent clinical experience may also qualify.

Counselors must be able to:

- Present didactic material in an understandable way
- Elicit family participation in structured exercises
- Intervene in family discussions to improve dysfunctional family interactions
- Be flexible enough to adapt the intervention to the specific needs of each family

Each family participates in the program for 13 weeks, with one 1.5- to 2-hour session per week. One full-time counselor can provide FET to 15 to 20 families per week, depending on the experience and maturity of the counselor.

3. Descriptive Information

| Areas of Interest | Substance Abuse Prevention  
| | Violence Prevention |
| Outcomes | Program evaluation showed Family Effectiveness Training helped Hispanic/Latino immigrant families with 6- to 12-year-old children, particularly in cases where the child is exhibiting behavior problems, associating with deviant peers, or experiencing parent-child communication problems.  
| | FINDINGS:  
| | - 35% reduction in children’s disruptive behaviors  
| | - 66% reduction in children’s associations with antisocial peers  
| | - 34% reduction in children’s irresponsible behaviors  
| | - 14% improvement in children’s self-concept  
| | - 75% improvement in family functioning |

| Outcome Categories | Alcohol  
| | Crime/delinquency  
| | Drugs  
| | Education |

*Excellence in Prevention* is a project of Oregon Addiction and Mental Health Services and Washington Division of Behavioral Health and Recovery. Information is drawn from many sources, including the National Registry for Effective Prevention Programs (NREPP), sponsored by the Center for Substance Abuse Prevention.
8. Study Populations

Evaluation Methodology

FET was evaluated using a Solomon Group Four design with a clinical extension. Seventy-nine Hispanic families were randomized either to receive FET or to a minimum contact control condition. To control for a testing bias in the results, some members of the treatment group and some members of the control group were not given a pretest. Posttest assessments were conducted at about 13 weeks (around the time the FET condition was completed). Those in the control group had the opportunity to receive the treatment after the 13-week posttest was administered. A follow-up was conducted 6 months after the posttest. Families assigned to FET received 13 lessons, at a rate of one lesson a week. Families assigned to the control group had only minimal contact with program staff.

Evaluation Outcome

Youths who received FET had significantly fewer behavioral, personality, and inadequacy problems and reported greater improvement in their feelings about themselves at the termination of treatment, compared with the control group. FET significantly improved the family structure, functioning, resonance, developmental stage, and conflict resolution.
