1. **Overview and description**

Guiding Good Choices (GGC) is a drug use prevention program that provides parents of children in grades 4 through 8 (9 to 14 years old) with the knowledge and skills needed to guide their children through early adolescence. It seeks to strengthen and clarify family expectations for behavior, enhance the conditions that promote bonding within the family, and teach skills that allow children to resist drug use successfully. GGC is based on research that shows that consistent, positive parental involvement is important to helping children resist substance use and other antisocial behaviors. Formerly known as Preparing for the Drug Free Years, this program was revised in 2003 with more family activities and exercises. The current intervention is a five-session curriculum that addresses preventing substance abuse in the family, setting clear family expectations regarding drugs and alcohol, avoiding trouble, managing family conflict, and strengthening family bonds. Sessions are interactive and skill based, with opportunities for parents to practice new skills and receive feedback, and use video-based vignettes to demonstrate parenting skills. Families also receive a Family Guide containing family activities, discussion topics, skill-building exercises, and information on positive parenting.

2. **Implementation considerations (if available)**
### Areas of Interest
- Mental health promotion
- Substance abuse prevention

### Outcomes
1. Substance use
2. Parenting behaviors and family interactions
3. Delinquency
4. Symptoms of depression (adolescents)

### Outcome Categories
- Alcohol
- Crime/delinquency
- Drugs
- Family/relationships
- Mental health
- Social functioning
- Tobacco

### Ages
- 6-12 (Childhood)
- 13-17 (Adolescent)
- 26-55 (Adult)

### Genders
- Data were not reported/available.

### Races/Ethnicities
- White

### Settings
- School

### Geographic Locations
- Rural and/or frontier

### Implementation History
The GGC curriculum was field-tested over 2 years in 10 public schools in Seattle, Washington, under the name Preparing for the Drug Free Years before being made into a video-assisted program for wider distribution in 1987. A multicultural population of Hispanic, African American, Samoan, American Indian, and White families was represented in that initial trial. Since 1987, GGC workshops have been delivered to urban, suburban, and rural families in all 50 States and the District of Columbia, Puerto Rico, the U.S. Virgin Islands, Canada, Cyprus, the Netherlands, Spain, Sweden, and the United Kingdom. In 1993, GGC was implemented as part of an experimental, longitudinal study in rural Midwest communities. The curriculum developer estimates that more than 302,000 families have been served by GGC since 1987.

4. Outcomes

Outcome 1: Substance abuse

<table>
<thead>
<tr>
<th>Description of Measures</th>
<th>Substance use was measured by youth self-reports of the frequency and quantity of use of alcohol, tobacco, marijuana, and other illicit drugs. Data were collected at pretest and 9, 21, 33, 51, and 75 months after the intervention.</th>
</tr>
</thead>
</table>
| Key Findings            | Adolescents from families assigned to the intervention who reported they had not used substances 1 year after the intervention were more likely to remain nonusers 2 years later compared with adolescents from families not assigned to the intervention.  
Adolescents from families assigned to the intervention who did not report having used substances 1 year after the intervention were more likely to remain at the same level of use 1 year later compared with adolescents from families not assigned to the intervention (p < .05).  
Through 4 years following the intervention, adolescents from families assigned to the intervention reported less increase in lifetime marijuana use and drunkenness and less growth in alcohol use compared with adolescent from families not assigned to the intervention (p < .05). Overall, substance use increased at a slower rate for the GGC group compared with the control group.  
Adolescents from families assigned to the intervention also had a slower overall rate of increase in self-reported lifetime cigarette use and total tobacco use index through 6 years following the intervention (p < .05). |
| Studies Measuring Outcome | Study 2                                                                                                                            |

**Outcome 2: Parenting behaviors and family interactions**

| Description of Measures | Parenting behaviors and family interactions (known risk and protective factors for adolescent substance use) were assessed using self-report measures and direct observation of family interactions in a general discussion task and a problem-solving task. Parental behaviors included intervention-specific skills and general child management skills. Intervention-specific skills included communicating clear rules about substance use, explaining consequences and rewarding compliance with substance use rules, helping the child learn how to express and control anger, and finding ways to keep the child involved in family activities and decisions. General child management skills included rewarding positive child behavior, child monitoring, and effective discipline. |
|-------------------------|------------------------------------------------|--|
| Key Findings            | Parents assigned to the intervention reported or demonstrated better intervention-specific and general child management skills compared with parents in the control group (p < .05). Outcomes were best for parents who attended the intervention classes regularly and reported higher readiness for parenting change. Observations of family interactions indicated that mothers assigned to the intervention exhibited less negative interaction in the general discussion task and more proactive communication in both tasks compared with control group mothers (p < .05). Mothers assigned to the intervention also used a less interrogating style and less antagonistic behavior in interacting with their children compared with control group mothers (p < .03). Fathers assigned to the intervention exhibited more proactive communication and better relationship quality in the problem-solving task compared with control group fathers (p < .05). On self-report measures, mothers assigned to the intervention were more likely than control group mothers to report that they reward their child for prosocial behavior, communicate rules about substance use, punish their child for misbehavior, restrict their child's alcohol use, expect their child to refuse a beer from a friend, express less conflict with their spouse, and work at being more involved with their child (p < .05). Fathers assigned to the |
intervention were more likely than control group fathers to report
more communication with their child regarding rules on substance
use and more involvement from their child (p < .05).

In a subsequent study, parents assigned to the intervention
reported better intervention-specific parental behaviors compared
with control group parents (e.g., communicating clear rules about
substance use, explaining consequences and rewarding
compliance with substance use rules, helping the child learn how
to express and control anger, and finding ways to keep the child
involved in family activities and decisions). The effect size for this
finding was small (Cohen's d = 0.45).

Intervention parents also reported better general child
management and parent-child affective quality (p < .05); this result
was maintained 1 year after the intervention with a small effect size
(Cohen's d = 0.29).

Parents assigned to the intervention also reported establishing
stronger norms against alcohol use relative to control group
parents 3.5 years after the intervention (p < .05).

<td>2.9 (0.0-4.0 scale)</td>
</tr>
</tbody>
</table>

**Outcome 3: Delinquency**

**Description of Measures**

Adolescents were asked to report their involvement in a range of
non-drug-related delinquent activities in the past 12 months. The
range of activities included items such as taking something worth
$25 or more and purposely damaging public property. Data were
collected at pretest and 9, 21, 33, and 51 months after pretest.

**Key Findings**

Adolescents from families assigned to the intervention had a
slower rate of increase in self-reported activities associated with
delinquency compared with adolescents from families not
assigned to the intervention (p < .05). In addition, the frequency of
participation in these activities served as a reliable predictor of
substance use (p < .01).

</table>
Outcome 4: Symptoms of depression (adolescents)

| Description of Measures | Adolescents were asked to report feelings and behaviors associated with depression at the time of assessment or in the preceding 6 months. The measure included 8 items such as "I feel worthless or inferior," "I am unhappy, sad, or depressed," and "I think about killing myself." Data were collected at pretest and 9, 21, 33, and 51 months after pretest. |
| Key Findings | Adolescents from families assigned to the intervention had a slower rate of increase in self-reported depressive symptoms compared with adolescents from families not assigned to the intervention (p < .05). |

Quality of Research Ratings by Criteria (0.0-4.0 scale)

External reviewers independently evaluate the Quality of Research for an intervention's reported results using six criteria:

1. Reliability of measures
2. Validity of measures
3. Intervention fidelity
4. Missing data and attrition
5. Potential confounding variables
6. Appropriateness of analysis

For more information about these criteria and the meaning of the ratings, see Quality of Research.

</tbody>
</table>

Study Strengths

Measures of substance use are typical of those used in similar research. The authors provided a standardized training program to staff who delivered the intervention; tracked fidelity of implementation using videotapes and systematic observations, made efforts to address potential confounds, and statistically accounted for missing data.

Study Weaknesses

In one study, 43% of the sample pool declined to participate, so it appears that the participants were highly motivated; it is unclear how this might have affected the results. Between 18% and 26% of the intervention curriculum was not covered in one study.

10. Readiness for Dissemination

The documents below were reviewed for Readiness for Dissemination. Other materials may be available. For more information, contact the developer(s).
Excellence in Prevention – descriptions of the prevention programs and strategies with the greatest evidence of success

Dissemination Materials

Readiness for Dissemination Ratings by Criteria (0.0-4.0 scale)

External reviewers independently evaluate the intervention's Readiness for Dissemination using three criteria:

1. Availability of implementation materials
2. Availability of training and support resources
3. Availability of quality assurance procedures

For more information about these criteria and the meaning of the ratings, see Readiness for Dissemination.

<table>
<thead>
<tr>
<th>Implementation Materials</th>

</tbody>
</table>

Dissemination Strengths

Program materials provide everything needed for implementation. Instructions are clear and concise, and the layout and graphics of the materials are high quality. Training for workshop leaders and certified trainers is available. Pre- and posttest surveys and instructions are provided to support quality assurance. Fidelity is emphasized throughout the program materials.

Excellence in Prevention is a project of Oregon Addiction and Mental Health Services and Washington Division of Behavioral Health and Recovery. Information is drawn from many sources, including the National Registry for Effective Prevention Programs (NREPP), sponsored by the Center for Substance Abuse Prevention.
Dissemination Weaknesses

While refresher courses are available, no ongoing training for advanced trainers and workshop leaders is available. No tools are provided in the program kit for conducting follow-up evaluation with families.

11. Costs

The information below was provided by the developer and may have changed since the time of review. For detailed information on implementation costs (e.g., staffing, space, equipment, materials shipping and handling), contact the developer.

<table>
