1. Overview and description

One form of retail alcohol regulation retail outlets is for the government to monopolize ownership of one or more types. The idea of government ownership of alcohol sales outlets in the interest of public order or public health first arose around 1850. A government monopoly typically greatly reduced the number of outlets, limited the hours of operation for sales, and removed the private profit motive for increasing sales.

Excellence in Prevention is a project of Oregon Addiction and Mental Health Services and Washington Division of Behavioral Health and Recovery. Information is drawn from many sources, including the National Registry for Effective Prevention Programs (NREPP), sponsored by the Center for Substance Abuse Prevention.
4. Outcomes

Scientific Evidence

Studies examining policy changes from state monopolization of alcohol sales to privatization generally find an increase in overall consumption following privatization (Holder & Wagenaar, 1990; Wagenaar & Holder, 1995), but rarely report on consumption by young people.

One of the few studies focusing on youth describes the effects on drinking among 13- to 17-year-olds in a Finnish township, when medium strength beer was made available in grocery stores as opposed to being available only in state monopoly stores. Results show that age limits were observed less strictly in grocery stores and that the beverage of choice among girls changed from wine to medium strength beer. Therefore, minors could purchase alcohol more easily than when sales had been restricted to state stores and drinking among 13 to 17-year-olds increased (Valli, 1998).
Elimination of a private profit interest typically facilitates the enforcement of rules against selling to minors or the already intoxicated (Her, Giesbrecht, Room, & Rehm, 1999).

State retail alcohol monopolies are associated with reduced underage drinking and reduced deaths of impaired drivers aged 20 and younger. In states with a retail monopoly over spirits or wine and spirits, an average of 14.5 percent fewer high school students reported drinking alcohol in the past 30 days and 16.7 percent fewer reported binge drinking in the past 30 days than did high school students in non-monopoly states. Monopolies over both wine and spirits were associated with larger consumption reductions than monopolies over spirits only. Lower consumption rates in the monopoly states, in turn, were associated with a 9.3 percent reduction in the impaired-driving death rate of drivers aged 20 and younger in monopoly states versus non-monopoly states. The analysis suggests that alcohol monopolies prevent 45 impaired-driving deaths each year (Miller, Snowden, Birckmayer & Hendrie, 2006).

10. Readiness for Dissemination

As of June 1, 2012, there is no state liquor retail monopoly in Washington.
